SB-200 TRAUMA STATION

Just a few years ago the idea of stocking trauma supplies at a school, church or office complex seemed unusual and unnecessary. But times have changed and those locations are now increasingly targeted for violence, resulting in multiple traumatic injuries.

Mass trauma events ranging from attacks at outdoor concerts to school and workplace shootings now occur at a frequency & severity never seen before. No location seems immune.

The message has become tragically clear: Preparedness and vigilance are now required, as injuries previously confined to faraway combat zones now occur randomly and unpredictably around America.

Uncontrolled bleeding from penetrating wounds may be severe, and can result in death in as little as 5 minutes. Immediate action is required.

Many locations however, lack the basic equipment needed to control dangerous hemorrhage during a trauma event, such as tourniquets & bandages, and thus remain less than fully prepared.

The SB-200 Trauma Station is a low profile, wall-mounted cabinet that contains emergency supplies most needed during a mass trauma event.

About the size of a standard AED cabinet, this kit has items required to control severe bleeding caused by penetrating wounds (*gunshot & stabbing*) for multiple victims.

Quick access to these items during a mass trauma event can & does save lives!
